BL 1200 – Ideal for any laboratory

- Automatic loading into analyzer racks or bins
- Eliminates pre-racking
- Intelligent sample routing based on customized sort rules and/or LIS
- Suitable for capped tubes of standard sizes and preparations
- Compatible with a range of rack options from various suppliers
- Modular construction enables a range of configurations
- Slim profile
- Safe, rapid, and continuous operation without error
BL1200 – Ideal for any laboratory

Proven reliability in a new design

Bulk sorters have considerably contributed to relieving the sample reception workload of the laboratory staff and are attracting a growing demand. A sorter does not require a lot of space, features a high throughput, enables automatic sorting and feeding of samples tubes into analyzer racks and, therefore, can provide incredible flexibility. Sarstedt’s new generation of the proven Bulk Sorter BL 1200 is the the perfect stand-alone solution in addition to laboratory automation concepts. As there is no need for sample tubes that are not processed via the integral analyzer systems to take this detour, they are selected in advance and supplied directly to the respective offline work stations. The BL 1200 can either be integrated in the workflow as a stand-alone option or linked to automated analyzer lines that include a full range of functions.

BL 1200 Sorting

- Sorts to racks or bins (module-dependent)
- Sorts according to material or order received from the LIS
- Freely configurable platforms for any standard rack option
- Automatic sample re-entry into the bulk loader if analysis order is not yet available
- Plausibility check
- Material/ID linked (flexible material code)
- Separate target bins for customized tubes
- Separation of error samples

BL 1200 Compability

- Accommodates tube options from a range of manufacturers, 75 – 120 mm long, 11 – 19 mm Ø (dimensions include cap)
- Processes a range of materials such as serum, plasma, whole blood, urine, etc.

BL 1200 Performance

- Capacity: approximately 600 tubes
- Cap color and tube geometry identification via camera
- Throughput of up to 1,200 tubes/hour
